Dashboard Showcase

Food Delivery Analysis

Demonstrating end-to-end analytics in Databricks

Available resources in GitHub Repository.

Armando Castillo • Data/Analytics Engineer

Goal

Build a clean, interactive dashboard that answers key business questions and enables a clear analysis.

Data

Food delivery data provided by Kaggle.
Data is stored in GitHub repository.

Data workflow

- Connect data
- Clean & validate (types, nulls, duplicates)
- Transform into analytics-ready tables
- Build visuals
- Publish

Insights

1. Fulfillment

Delivered: 895 (**34.4%**)
Cancelled: 873 (**33.6%**)
Delayed: 832 (**32.0%**)
Only 1 of 3 orders are successfully completed.

2. Revenue Seasonality

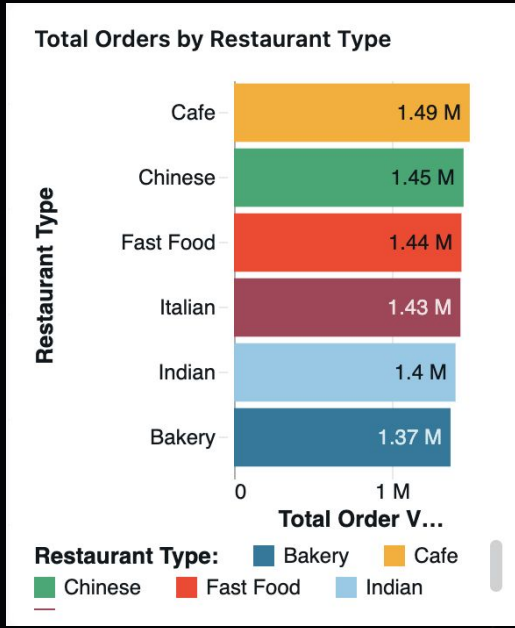
The highest order volume was in October (250 orders), May (239) and August/November (237 each).

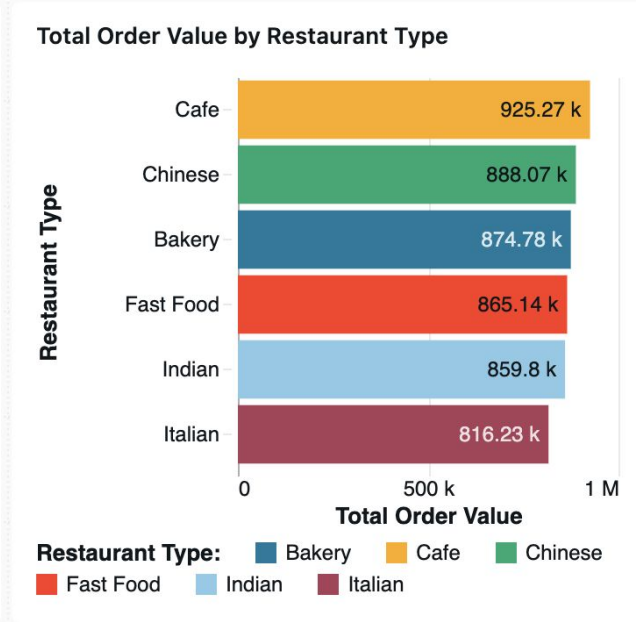
3. Segmentation

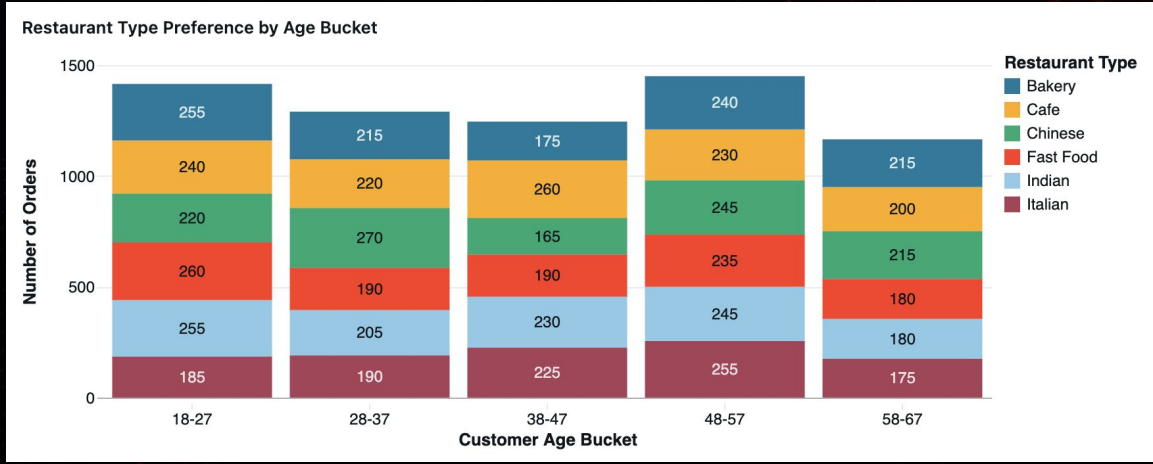
Cafe was the top-performing category by revenue, then Chinese and Bakery.
Chinese is the best rated type of restaurant as well.

4. Age bucket

here is a restaurant type preference by age, the most popular ones are: Indian food for the 48-57 age group, Cafe food for the 28-47 age group and Bakery food for the 18-27 age group.







Final thoughts

This project showcases my ability to build and analyze dashboards in Databricks, transforming raw delivery data into actionable insights.

By identifying revenue trends, segment performance, and operational patterns, I was able to present clear findings that support smarter business decisions.

Access to dashboard in GitHub Repository.
